

Through our partnership with care optimization company axialHealthcare providers have access to a range of resources that aim to improve patient safety. This month axialHealthcare is launching Risk Identification and Mitigation (RIM) Reports, a risk reporting tool showing how a providers' opioid prescribing may be impacting patient safety.

Understanding RIM

A RIM score provides a claims-based assessment of patient risk driven by a provider's opioid prescribing practices. As an educational tool, it is leveraged by providers to improve patient safety related to opioid prescribing.

Patients included in the assessment are assigned to one of two cohorts, chronic opioid use or acute opioid use. Standardized quality measures have been assigned to each cohort, ensuring that prescribing quality is appropriately assessed.

Exploring Interactive Capabilities

Through the interactive RIM dashboard, providers can view a breakdown of the patients considered in their scoring assessment. Providers can view their rating on individual cohort-specific quality measures, and refine down to the patient level to identify care improvement opportunities and risks.

Leveraging Clinical Support

With care improvement opportunities and risks identified, the axialHealthcare Clinical Consult Services Team is available to collaborate with providers to reduce patient risks related to opioid over-prescribing and opioid use disorder. The team will also share clinical decision support resources as appropriate.

Accessing Solutions

The RIM dashboard can be accessed at practice.axialhealthcare.com. If you need help accessing the portal, or need clinical support, contact axialHealthcare's Clinical Consult Team directly at 615-475-5055 or providersupport@axialhealthcare.com.
